

Appendix A
State of Mississippi
Water Quality Assessment
2010 Section 305(b) Report

Introduction

MDEQ manages its surface water programs on a river basin scale and has established a process that coordinates the water assessment and management activities of numerous state and federal agencies. This process, the Mississippi Basin Management Approach, is responsible for the development of and recurring updates to, basin management plans for Mississippi's major river basins. This appendix provides water quality assessment information specific to each of the state's major river basins. The information in this appendix is strictly a representation of the statewide §305(b) assessments broken down by river basin.

Hydraulically, the waters of Mississippi are divided into ten major drainage areas or river basins. These ten basins are the Big Black River Basin, Coastal Streams Basin, Mississippi River Basin, North Independent Streams Basin, Pascagoula River Basin, Pearl River Basin, South Independent Streams Basin, Tennessee River Basin, Tombigbee River Basin and Yazoo River Basin. For MDEQ management purposes, the Mississippi River Basin has been divided into upper and lower portions. The upper portion has been grouped with the Yazoo River Basin and the lower portion has been grouped with the South Independent Streams Basin.

In the following sections, surface water quality assessment data are presented in the form of an alphabetical listing of all individual water body assessments made for the 2010 §305(b) report. With each water body entry, pertinent information regarding water body ID number, reach location, assessed use, assessment status and numeric category designation are shown. This table also provides the necessary information to cross-reference §305(b) assessments with the 2010 §303(d) list. It should be noted that the assessment information provided in the detailed listing is accurate as of April 1, 2010, which may be different from the 2010 §303(d) list.

The integrated assessment guidance from USEPA allows segments to be assigned to one of five categories at the designated use level. This results in water bodies with multiple uses that often have multiple categories. This categorization system assigns a water body to one of five categories by use:

Category 1: Attaining all uses

Category 2: Attaining some uses but insufficient information for assessment of other uses.

Category 3: Insufficient information to assess any use

Category 4: Not attaining a use but a TMDL is not necessary

Category 5: Not attaining a use and a TMDL is needed.

USEPA defines a Category 1 water as having sufficient data to prove there is no impairment for any potential designated use of that water body. Since Mississippi rarely has data for all designated uses on a specific water body, Mississippi currently has no water bodies assigned to Category 1.
